

Demand Driven MRP DDMRP aims to sort out those significant few items that deserve serious attention from the parts being managed. It has several distinct components. Strategic Inventory Positioning is all about knowing where to place inventory to seek the best possible protection. Buffer Profiles and Level involves determining the actual levels of stock buffers. Grouping parts and materials that behave similarly is necessary for creating buffer profiles. Dynamic Adjustments involves dynamically changing the buffer levels. With Highly Visible and Collaborative Execution, an execution horizon refers to the time from which an order is opened until it is closed in the system of record. Do note that it is most useful for a CTO Configure to Order environment.
